DEVELOPMENT OF TOOTH - BUD STAGE:

* Dental lamina - a small bud like structure extends from the basement membrane which constitutes primordium for enamel organ is seen.

* The enamel organ consists of peripherally located low columnar cells and central polyhedral cells.

* Areas of ectomesenchymal condensation surrounding the enamel organ is called dental sac or follicle.

DEVELOPMENT OF TOOTH - CAP STAGE -

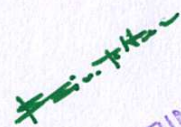

→ The bud shaped enamel organ due to unequal growth becomes cap stage.

→ In the peripheral cell lining the convex portion of the cap are cuboidal and are called outer enamel epithelium.

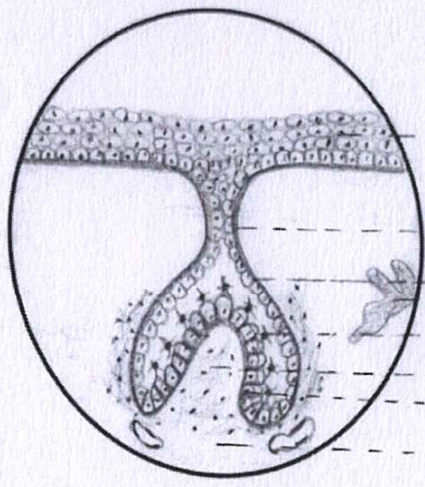

→ The concave portion of the cap shows columnar cells and are called inner enamel epithelium.

→ The polygonal cells located at the center of the epithelium becomes star shaped and are called stellate cells.

→ The ectomesenchymal condensation seen in the invaginate portion of the cap is called dental papilla.
